

## Modern Periodic Table arranged by:

- Periods= number indicates the principal energy level where the \_\_\_\_\_ are located
  - \_\_\_\_\_ on table
- Groups= elements with the \_\_\_\_\_ of valence electrons and thus similar or related \_\_\_\_\_
  - \_\_\_\_\_ on table
  - Also known as ' \_\_\_\_\_ '

3

## Arrangement continued:

- Also broken down into metals, non-metals and metalloids or semimetals (B, Si, Ge, As, Sb, Te) based on:
  - Physical properties: \_\_\_\_\_, \_\_\_\_\_, hardness, \_\_\_\_\_, \_\_\_\_\_, malleability, solubility, \_\_\_\_\_ and boiling points
  - Chemical properties or reactivity:
    - \_\_\_\_\_ (active)
    - \_\_\_\_\_ (inactive)
    - \_\_\_\_\_ (normally do not react) → Noble Gases

4

## Metals: Left side of table

---

- Alloys: mixtures of metals that result in \_\_\_\_\_ and properties (stainless steel, brass, bronze)
- Metallic properties \_\_\_\_\_ as you go down a group (\_\_\_\_\_ ionization energy and electronegativity)
- Most active metals found, \_\_\_\_\_ of table
- Density greater than \_\_\_\_\_ (except group 1)
- \_\_\_\_\_ electrons to form (\_\_\_\_) ions with a \_\_\_\_\_ atomic radius

5

## Properties of Metals

---

- \_\_\_\_\_ of all elements are metals
- \_\_\_\_\_ (shiny)
- \_\_\_\_\_ (shapeable with a mallet)
- \_\_\_\_\_ (can be drawn into thin wire)
- \_\_\_\_\_ conductor of electricity and heat
- \_\_\_\_\_ at room temp (except Hg=liquid)

6

### Non-Metals: Top right side of table

- \_\_\_\_\_, molecular or network \_\_\_\_\_ at room temp. (Br, bromine is an exception as it is in liquid form)
- \_\_\_\_\_ Ionization Energies (I.E.) and electronegativity
- Most active non metals, found in \_\_\_\_\_ of table
- \_\_\_\_\_ electrons to form (\_\_\_\_\_) ions with a \_\_\_\_\_ atomic radius

7

### Properties of Non-Metals

- Less than \_\_\_\_\_ of all elements are non-metals
- \_\_\_\_\_, no luster
- \_\_\_\_\_ (if solid)
- \_\_\_\_\_
- \_\_\_\_\_ conductor of electricity and heat

8

## Allotropes:

- Two or more forms of the \_\_\_\_\_, differing in molecular or crystalline \_\_\_\_\_.
- Results in different \_\_\_\_\_
- Ex. Carbon: \_\_\_\_\_, \_\_\_\_\_, Fullerenes (buckyballs)

- Ex. Oxygen: O<sub>2</sub> and O<sub>3</sub> (ozone)

9

## Hydrogen:

- Both \_\_\_\_\_ and \_\_\_\_\_ properties
- Does \_\_\_\_\_ belong to group 1
- Does \_\_\_\_\_ have similar properties to group 1 elements
- Can \_\_\_\_\_ or \_\_\_\_\_ an electron to form (+/-) oxidation numbers
  - Ex. when bonding to a metal= metal \_\_\_\_\_
    - Na<sup>+</sup> + H<sup>-</sup> → NaH

10

Group 1: Alkali metals  
Group 2: Alkaline Earth metals

---

- Occur in nature only in \_\_\_\_\_ due to \_\_\_\_\_ reactivity
- Easily \_\_\_\_\_ electrons due to low I.E.
- Typically form stable \_\_\_\_\_ compounds (with \_\_\_\_\_)
  - Ex. Sodium Chloride: NaCl
- Elements can be reduced to their free state by \_\_\_\_\_

11

Group 3-12: Transition elements

---

- May exhibit multiple oxidation states
- Are generally less active than groups \_\_\_\_\_
- Form ions with \_\_\_\_\_ (ex.  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  is blue)

12

## Group 17: Halogens

---

- Occur only as \_\_\_\_\_ due to high reactivity
- Fluorine also derived by \_\_\_\_\_
- Salts formed called \_\_\_\_\_
- Held together by \_\_\_\_\_ forces
- Only group to contain all \_\_\_\_\_ at room temperature
  - F, Cl → \_\_\_\_\_
  - Br → \_\_\_\_\_
  - I → \_\_\_\_\_

13

## Group 18: Noble Gases

---

- \_\_\_\_\_ elements with filled valence shells
  - Can be found as individual \_\_\_\_\_
- May actually form bonds (though not common)

14

\*

\*\*

- 
- \*Lanthanides: elements 58-71 (extension of period 6)
    - all have similar properties to \_\_\_\_\_
    - Would be stacked like a deck of cards on #57
  - \*\*Actinides: elements 89-103 (extension of period 7)

15

### Naming elements over 100= latin root system

---

- 0= \_\_\_\_\_
- 1= \_\_\_\_\_
- 2= \_\_\_\_\_
- 3= \_\_\_\_\_
- 4= \_\_\_\_\_
- 5= \_\_\_\_\_
- 6= \_\_\_\_\_
- 7= \_\_\_\_\_
- 8= \_\_\_\_\_
- 9= \_\_\_\_\_

Three prefixes + ium ending

Ex. 117 = \_\_\_\_\_

Ex. 209 = \_\_\_\_\_

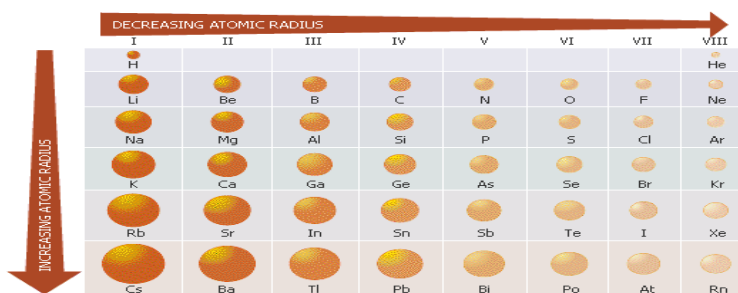

Ex. 320 = \_\_\_\_\_

16

## Atomic Radius

- \_\_\_\_\_ the distance between adjacent nuclei of the same element
- helpful to determine \_\_\_\_\_, solubility, \_\_\_\_\_ point and acid strength

17

## Atomic Radius

- Across period (left to right) a \_\_\_\_ occurs
  - as atomic number \_\_\_\_, nuclear charge also \_\_\_\_ due to \_\_\_\_\_ protons
  - Electrons are held more tightly around the nucleus, thus radius will \_\_\_\_
- Down a group (top to bottom) an \_\_\_\_ occurs
  - additional energy levels will shield the (\_\_\_\_) nucleus, thus the attractive force is \_\_\_\_\_ and the radius will \_\_\_\_

18

## Ionic Radius: relative to a neutral atom

- ( ) ion = smaller = known as a \_\_\_\_\_
- ( ) ion = larger = known as an \_\_\_\_\_

Atomic Radii of Alkali Metal Elements and Ions

Atomic Radii of Halogen Elements and Ions

19

## Ionization Energy

- A) The ease at which an atom will \_\_\_\_\_ an electron
- B) The smaller the IE, the easier the electron will be \_\_\_\_\_
  - 1) Metals have \_\_\_\_\_ IE (especially Groups 1+2)
  - 2) Non-metals have \_\_\_\_\_ IE
- C) \_\_\_\_\_ relationship exists between the size of an atom and its first Ionization Energy
  - 1) The larger the atom the \_\_\_\_\_ it will lose an electron, as it is \_\_\_\_\_ from positive nucleus
  - 2) The smaller the atom, the \_\_\_\_\_ to remove/lose an electron as it is \_\_\_\_\_ to positive nucleus

20

## Ionization Energy continued

- IE Summary
- Across a period = general \_\_\_\_\_
- Down a group = general \_\_\_\_\_
- 2nd + 3rd I.E. are successively \_\_\_\_\_ due to more (+) nucleus holding the outer electrons closer
  - Ex. 1st IE  $X + \text{energy} \rightarrow X^+ + e^-$
  - Ex. 2nd IE  $X^+ + \text{More energy} \rightarrow X^{2+} + e^-$

21

## Ionization Energy Periodic Trends

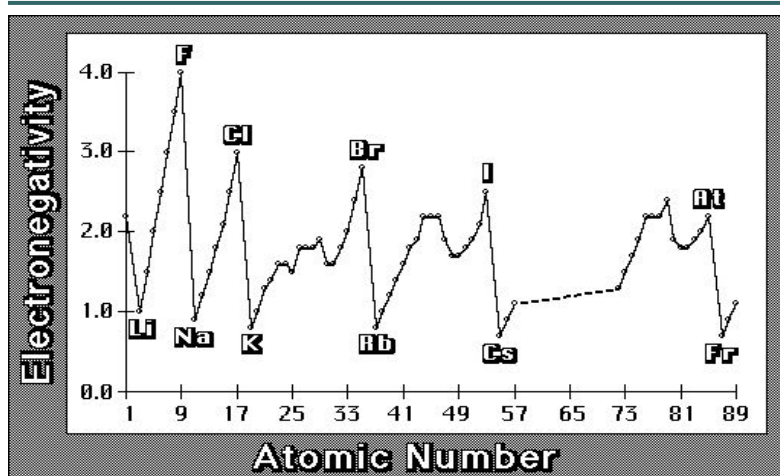

22

## Electronegativity:

- A measure of the ability of an atom or molecule to \_\_\_\_\_ in a chemical bond.
  - Across a period= general \_\_\_\_\_
  - Down a group = general \_\_\_\_\_
- Basis for determining bond types ( \_\_\_\_\_, \_\_\_\_\_ and \_\_\_\_\_)
  - If difference is zero = \_\_\_\_\_
  - Difference of 0.1→1.7 = \_\_\_\_\_
    - Though lower values are sometimes considered to be non-polar (ex. 0.1→0.3 etc)
  - Difference of 1.7 and above = \_\_\_\_\_

23

## Electronegativity:

24
